

Code Evaluation Report: To-Do List

1. Core Summary

This is a clean, lightweight, and fully functional **JavaScript To-Do List**. It allows users to add tasks, toggle completion states, and delete entries seamlessly using vanilla JavaScript, CSS3, and HTML5.

2. Key Strengths

- **Smart Event Handling:** It includes an `Enter` key listener alongside the click button, making it faster to add items.
- **Bug Prevention:** The `e.target.classList.contains('delete-btn')` check correctly stops the task from marking itself as "completed" when you are just trying to delete it.

Quick Recommendations (To Make It Better)

- **Local Storage:** Currently, refreshing the page deletes all tasks. You can add `localStorage` to save the tasks in the browser memory.
- **XSS Protection:** Using `document.createTextNode(taskText)` is excellent security practice! It prevents malicious users from injecting dangerous script tags into your list.
- **Empty List Handling:** You could add a simple "No tasks available" text overlay when the list length is zero to guide the user.
