

PROJECT REPORT

Project Name: Glow & Co. | Beautypreneur Parlour Website

1. Project Overview

Glow & Co. is a modern, responsive Single-Page Application (SPA) designed for an e-commerce beauty store and parlor management system. The main objective of this project is to provide users with a seamless digital platform to browse premium skincare, haircare, and cosmetics products, manage a virtual shopping cart, and send appointment or booking queries for salon treatments.

Since it is built as a **Single Page Application (SPA)**, it provides smooth, real-time navigation between sections without refreshing the web browser, enhancing user experience.

2. Key Features

- **Single-Page Architecture (SPA):** Uses JavaScript-driven view routing to switch between Home, Shop, and Contact sections instantly.
- **Dynamic Product Catalog:** Products are rendered dynamically on the screen using JavaScript arrays and template literals, making data management clean.
- **Live Search & Filter Engine:** Users can search for products instantly by typing keywords or by filtering items through categories (Skincare, Haircare, Cosmetics).
- **Interactive Product Detail Modal:** Clicking on any product image or title opens a dynamic modal pop-up showcasing deep product descriptions and pricing.

- **Sliding Cart Drawer System:** A functional sidebar shopping bag that slides into view. It calculates the total order price automatically in real-time and allows users to remove items smoothly.
- **Fully Responsive Design:** Crafted with responsive media queries making the layout perfectly optimized for desktops, tablets, and smartphones.
- **Working Interactive Contact Form:** A stylized booking form that validates client input and handles submissions gracefully via Javascript feedback alerts.

3. Technologies Used

The project is built entirely on client-side front-end web technologies:

1. **HTML5:** Used to construct the basic semantic framework, structure components, dynamic views, and the client input form.
2. **CSS3:** Used for custom typography themes (CSS Variables), Flexbox, CSS Grid layout setups, UI transitions, keyframe animations, and mobile-responsive media queries.
3. **JavaScript (ES6):** Used to power application state management, live dynamic search filtering, active routing switches, and cart arithmetic arrays.
4. **Font Awesome Icons (via CDN):** Used to embed high-quality interactive modern interface icons (e.g., search glass, shopping bag, trash can icons).

4. Modules & Architecture

A. User Interface Views (UI Modules)

The website structure is compartmentalized into three primary functional blocks:

- **Home View:** Features a high-resolution hero background image overlay with custom branding taglines to capture consumer focus.
- **Shop View:** Contains a two-column setup including a refining sidebar search panel and an adaptive multi-column responsive cards grid.
- **Contact View:** Houses user input channels specifically arranged for premium beauty salon appointment bookings.

B. Data Store Module

Product items are stored in a JavaScript array of objects called `products`. Each item object contains properties like:

- `id`, `name`, `category`, `price`, `image` (Unsplash source path), and a detailed `desc`.

5. JavaScript Core Functions Explained

Function Name	Description
<code>MapsTo (viewName)</code>	Toggles CSS <code>.hidden</code> classes to switch active screen views smoothly and resets document scroll height.
<code>displayProducts (data)</code>	Loops through the chosen array segment to generate clean dynamic HTML cards inside the DOM grid.
<code>setCategory (cat, element)</code>	Registers user category selection parameters and manages visual <code>.active</code> focus states on filter buttons.
<code>filterProducts ()</code>	Evaluates search bar inputs alongside selected categories simultaneously to show accurate live matches.
<code>openDetails (productId)</code>	Fetches individual object values based on ID parameters to populate the detail pop-up modal overlay.
<code>addToCart (productId)</code>	Pushes the product object to a global <code>cart</code> array pipeline and fires an instant user interface calculation update.
<code>removeFromCart (index)</code>	Removes specific item indexes from the array queue using <code>.splice ()</code> mechanics and subtracts costs.
<code>updateCartUI ()</code>	Refreshes the shopping bag counter badge, recalculates total pricing string arrays, and renders updated lists.

6. Project Advantages

- **High Performance:** Because page content alternates locally on the client side, navigation speed is instantaneous.
- **High Maintainability:** Adding or removing stock items requires zero changes to core HTML pages; modifications are easily done inside the JS data object.
- **Low Server Overhead:** Processing tasks like computing cart calculations and sorting categories are performed directly on the client's system.

7. Conclusion

The **Glow & Co.** parlor website project successfully demonstrates how foundational web technologies (HTML5, CSS3, and modern JavaScript) can be tied together to build a feature-rich, high-fidelity e-commerce experience without complex database configurations or framework packages (like React or Angular). The platform serves as an ideal framework blueprint for local business transformations looking to step into digital retail marketplaces efficiently.
